EXPERIMENT 9: AI AND ANALYTICS USING ZIA

AIM

To design, develop, and integrate an automated Artificial Intelligence and business analytics framework within a low-code enterprise application using Zoho Creator's conversational AI assistant, Zia. The objective is to employ Zia Build Agent to synthesize real-time Key Performance Indicator (KPI) summary metrics, generate multi-dimensional visual distribution charts, and dynamically link an analytical decision-support dashboard to an active automotive maintenance and repair management workflow.

APPLICATION CONTEXT & SYSTEM OVERVIEW

In modern enterprise applications, decision-makers require real-time visibility into operational metrics without requiring manual chart generation or complex data extraction scripts. Utilizing Zia—Zoho's built-in conversational and predictive AI engine—developers can describe analytical requirements in natural language. Zia parses contextual data schemas, identifies quantitative distributions across transactional tables (such as Service_Request_Form), and programmatically provisions visual components including metric aggregates, pie charts, column distributions, and donut diagrams.

PROCEDURE

Step 1: Accessing the Application Design Workspace

Navigate to the Zoho Creator application development console. Open the target system, 'Vehicle Service & Repair Request Management', in edit mode and select the 'Design' workspace tab. Locate and activate the Zia AI developer icon positioned on the left utility docking sidebar to launch the conversational AI build agent.

Step 2: Initializing the Zia Conversational Build Agent

Upon expanding the Zia Build Agent console ('Hi, I'm your AI developer. What would you like me to build today?'), review and dismiss the environment boundary notification to enable direct synthesis within the live application repository. The conversational prompt interface is now active and context-aware of existing application forms and relational modules.

Step 3: Formulating Analytical Prompts for Automated Synthesis

Provide a comprehensive natural language prompt instructing Zia to construct an operational decision-support dashboard: 'Create an Analytics Dashboard for Vehicle Service and Repair Request Management with KPI summary cards and charts to track service request status and vehicle models'. Zia processes the intent, maps the schema of Service_Request_Form, and proposes automated architectural changes including KPI metric aggregators and four visual data charts.

Step 4: Committing Synthesized Dashboard Components to Canvas

Select the 'Apply Changes' directive in the Zia Build Agent panel. Zia dynamically provisions a dedicated page titled 'Analytics Dashboard', integrates it into the primary navigation menu, and compiles four structured reporting widgets: Service Request Status Distribution (Pie Chart), Service Requests by Vehicle Model (Column Chart), Service Requests by Service Type (Column Chart), and Service Requests by Vehicle Type (Donut Chart) alongside aggregate KPI metric counters.

Step 5: Runtime Verification and Live Analytics Execution

Select 'Access this application' to launch the production runtime view of the system. Navigate to the newly integrated 'Analytics Dashboard' tab in the application sidebar. Validate that real-time transactional records from the vehicle maintenance database are accurately aggregated and rendered across the graphical distribution charts and KPI summaries.

RESULT

Thus, the implementation of AI and Analytics using Zia within the Zoho Creator low-code application environment was successfully completed. The conversational AI build agent successfully interpreted natural language specifications, mapped data schemas from the Vehicle Service & Repair Request Management system, and autonomously synthesized a functional analytical dashboard comprising KPI metric summaries and multi-dimensional distribution charts, confirming robust operational analytics and automated decision support.
