

EXPERIMENT 7 – ZOHO CREATOR API INTEGRATION

AIM

To create and configure a Custom API in Zoho Creator for the Vehicle Service & Repair Request Management application, using a Deluge function to retrieve service request details based on the Service Request ID.

ENTITIES / FEATURES USED

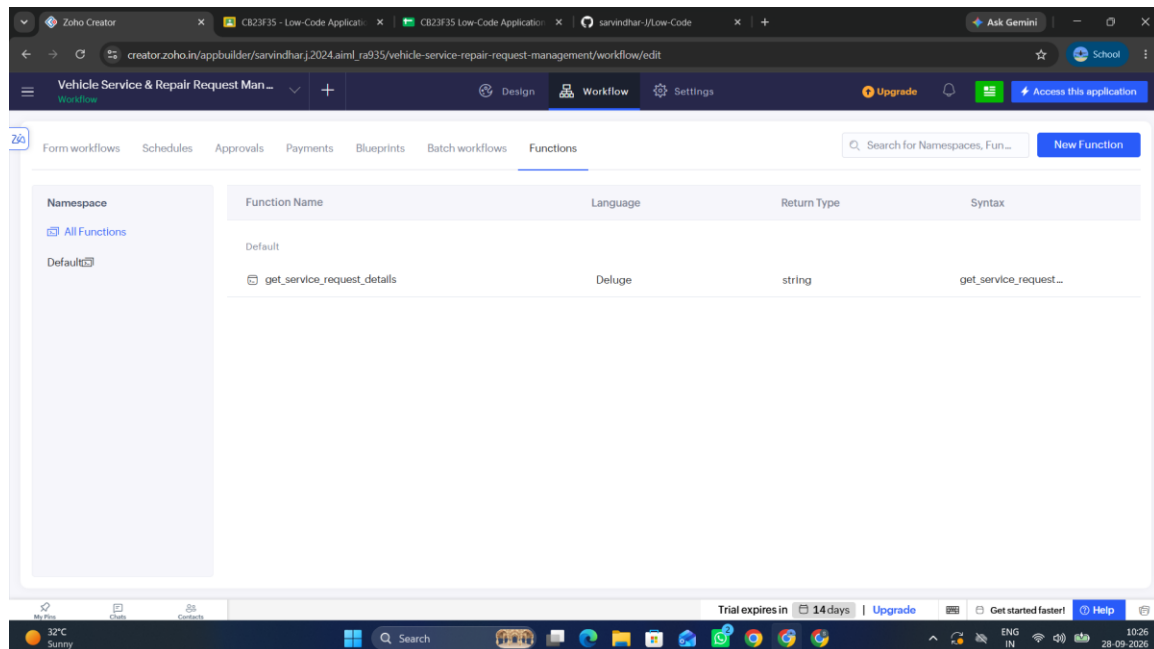

Zoho Creator Custom API; Custom API Builder; GET method; Public Key authentication; query parameter service_request_id; Deluge custom function get_service_request_details; Service_Request_Form; Service Request ID; Fetch Records operation; Standard JSON response; API endpoint.

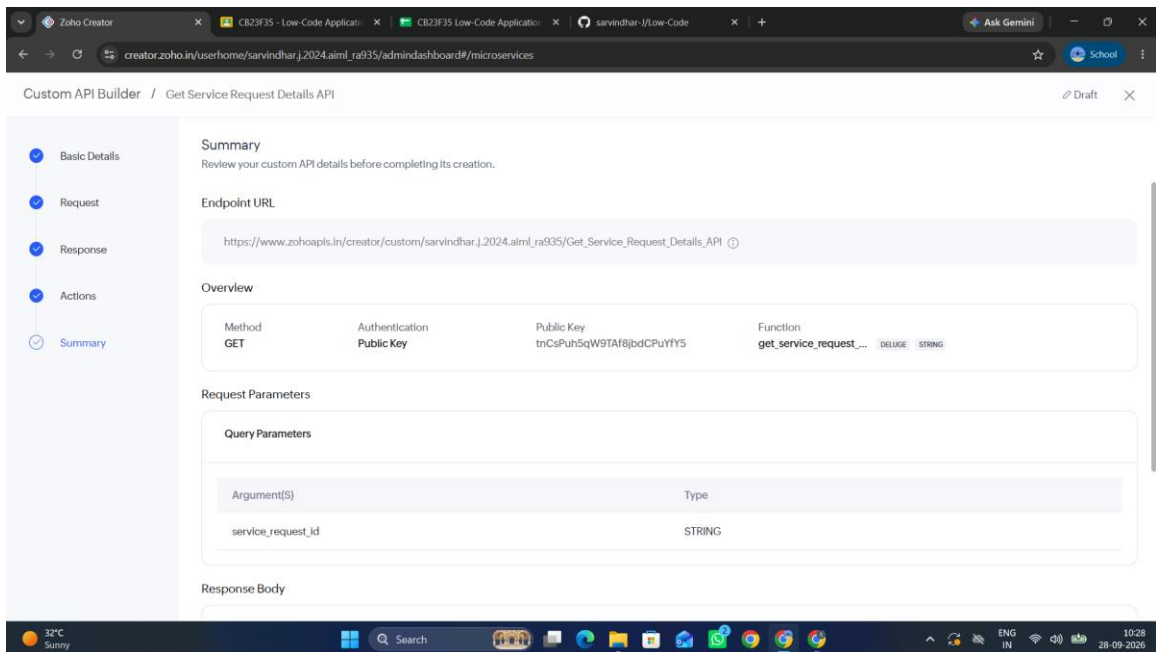

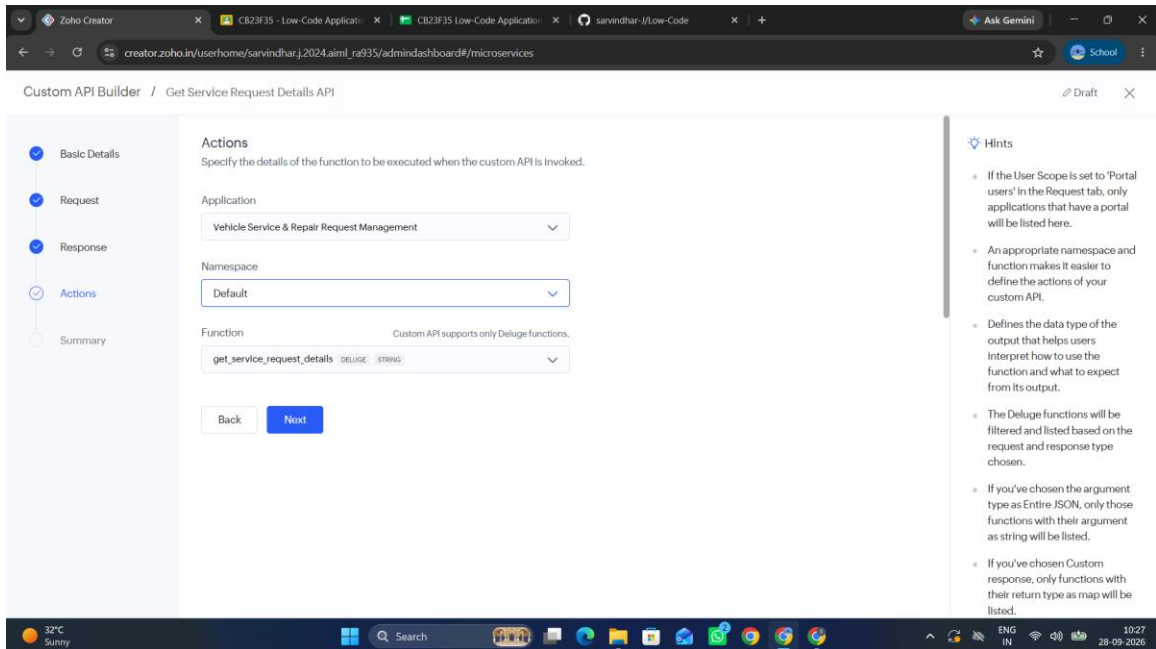

PROCEDURE

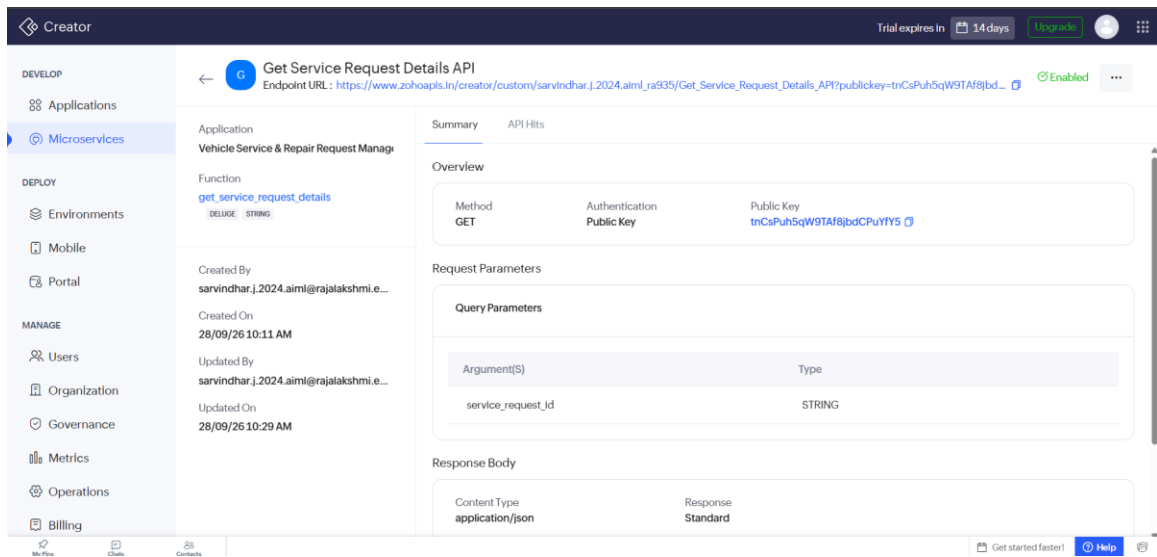

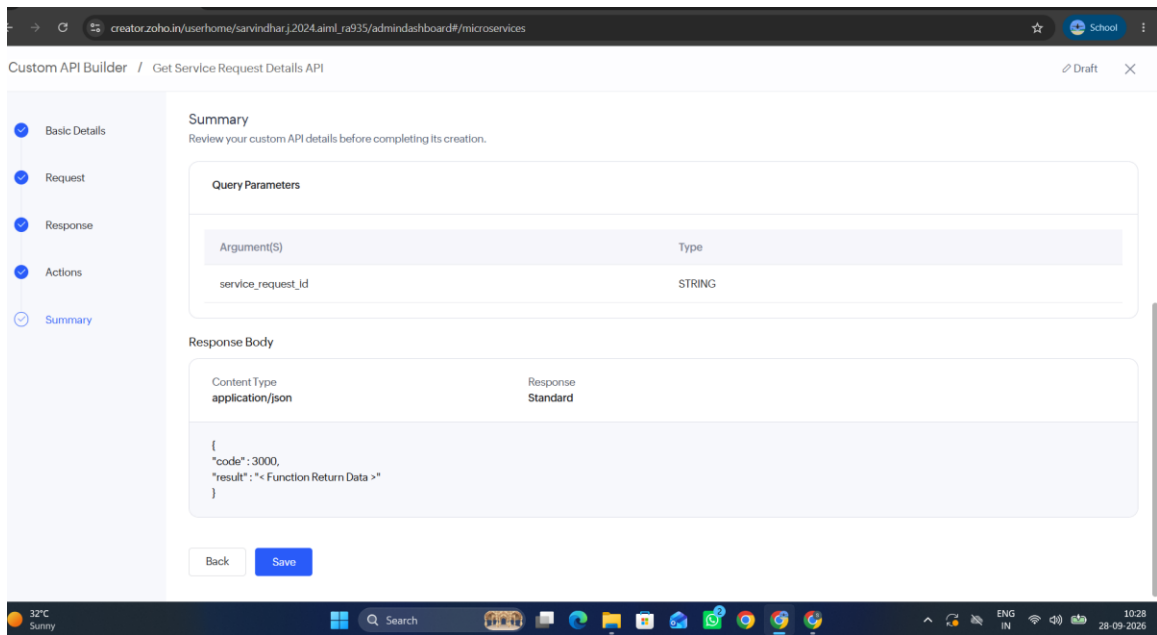

1. Created a Custom API named Get Service Request Details API.
2. Configured the API request method as GET and authentication as Public Key.
3. Created the Deluge function get_service_request_details with a service_request_id argument.
4. Configured the function to fetch the matching record from Service_Request_Form using the Service_Request_ID field.

5. Added a condition to return the fetched service-request details when a matching record is available; otherwise, the function returns a Service request not found message.
6. Associated the Deluge function with the Custom API under the Actions section.
7. Reviewed the generated endpoint, query parameter and Standard JSON response in the Summary section.
8. Saved the Custom API successfully.

SCREENSHOTS

RESULT

The Custom API was successfully created and configured in Zoho Creator. The API accepts a `service_request_id` query parameter and invokes the `get_service_request_details` Deluge function to retrieve the corresponding service request record from `Service_Request_Form`.
